## Abstract

Two new species of *Stenochironomus* Kieffer (Diptera: Chironomidae: Chironominae), *S. brevissimus* **sp. n.** and *S. linanensis* **sp. n.**, are described from China and the male imagines are illustrated. *S. brevissimus* **sp. n.** can be separated from the so far known species by having very short and small, spatulate superior volsella with two long setae, whereas *S. linanensis* **sp. n.** is easily separated from the other species of *Stenochironomus* by the following characters: wings transparent, body yellow, superior volsella finger-like, with nine long setae, elongated inferior volsella with four long setae and one well developed terminal spine; tergite IX with 10–15 long setae medially. A key to the males of *Stenochironomus* occurring in China is given.

## Keywords

*Stenochironomus*, new species, key, China

## Introduction

*Stenochironomus* Kieffer, 1919 is a species-rich genus with worldwide distribution, occurring in all biogeographical regions except in Antarctica (Cranston et al. 1989). The genus was erected by Townes in 1945 based on *Chironomus pulchripennis* (Coquillett, 1902) (Spies and Sæther 2004). The larvae are easily found mining decayed leaves or

wood in freshwater habitats ranging from small ponds and swamps to fast-flowing streams and rivers (Cranston et al. 1989). Based on the different hosts of larvae and pupae, Borkent (1984) erected two subgenera: *Stenochironomus s. str.* Kieffer (larvae and pupae mine dead submerged wood) and *Petalopholeus* Borkent (larvae and pupae mine dead submerged leaves). This subdivision has not been adopted by subsequent authors, because immature stages are known only for a few species, which makes difficult to ascribe them to any subgenus (Pinho et al. 2005, Andersen et al. 2008, Qi et al. 2008, Dantas et al. 2010, Zorina 2010). To date, there are 97 species recorded around the world: 24 species from the Palearctic Region, 17 from the Nearctic Region, 30 from the Neotropical Region, 16 from the Oriental Region, 16 from the Afrotropical Region and 4 from the Australasian Region (Qi et al. 2011, Reis et al. 2013).

Zhejiang Province is located in the Chinese central subtropical region, which has a humid monsoon climate. In Zhejiang, three species of *Stenochironomus* [*S. koreanus* Borkent, 1984, *S. nubilipennis* Yamamoto, 1981 and *S. satorui* (Tokunaga & Kuroda, 1936)] have been recorded (Wang 2000, Qi et al. 2011). In this paper, two new species of *Stenochironomus* from Zhejiang, Oriental China, are described and illustrated. A key to the males of *Stenochironomus* from China is presented.

## Materials and methods

The morphological nomenclature follows Sæther (1980). Measurement methods follow Qi et al. (2012). The material examined was slide-mounted, following the procedure outlined by Sæther (1969). Specimens have been deposited in the College of Life Science, Taizhou University, China.

Abbreviations of parts measured are as follows:

<b>AR</b>	Antennal ration, length of 13 <sup>th</sup> / length of flagellomeres 1–12
<b>Palpomere ratio (5th/3rd)</b>	Length of the 5 <sup>th</sup> Palpomere / length of the 3 <sup>rd</sup> Palpomere
<b>VR</b>	Venarum ration, length of Cubitus (Cu) / length of Media (M)
<b>BV</b>	Length of (femur + tibia + ta <sub>1</sub> ) / length of (ta <sub>2</sub> + ta <sub>3</sub> + ta <sub>4</sub> + ta <sub>5</sub> )
<b>LR</b>	Leg ration, length of ta <sub>1</sub> / length of tibia
<b>SV</b>	Length of (femur + tibia) / length of ta <sub>1</sub>
<b>HR</b>	Hypopygium ration, length of gonocoxite / length of gonostylus
<b>HV</b>	Hypopygium value, total length / length of gonostylus times ten
<b>p<sub>1</sub></b>	Fore leg
<b>p<sub>2</sub></b>	Mid leg
<b>p<sub>3</sub></b>	Hind leg
<b>fe</b>	femur
<b>ti</b>	tibia
<b>ta<sub>1</sub>...ta<sub>n</sub></b>	tarsus <sub>1</sub> ...tarsus <sub>n</sub>
<b>R</b>	Radius
<b>R<sub>1</sub></b>	Radius 1 vein
<b>R<sub>4+5</sub></b>	Radius 4+5 vein

## Taxonomy

### *Stenochironomus brevissimus* sp. n.

<http://zoobank.org/ADC155AF-0069-4052-8907-191E35A59854>

Figs 1–10

**Diagnosis.** The adult male of *S. brevissimus* sp. n. can be distinguished from all other species of *Stenochironomus* by the following combination of characters: superior volsella very short and small, spatulate, with 2 long setae, elongated inferior volsella with 6 long setae, posterior margin of tergite IX with 20–22 setae and 8 spines.

**Description.** Male imago ( $n = 3$ ). Total length 4.3–4.6 mm. Wing length 2.2–2.5 mm. Total length / wing length 1.8–1.9. Wing length / length of profemur 1.7–1.8.

Coloration. Head yellow, antenna brown. Thorax light yellow, postnotum and scutum with brown spots. Wings transparent, without any pigmentation. Abdomen and hypopygium yellow, anal point brown. Fore legs yellow with femur apically brown. Mid legs with apex and posterior basal region of femur with dark brown stripes, tibia brown, tarsomeres 1–5 yellow. Hind legs brown with femur yellow with dark brown stripes at apex.

Head (Fig. 1). AR 1.80–1.92. Temporal with 10–12 setae. Clypeus with 20–22 setae. Tentorium 173–176 mm long, 43–46 mm wide. Stipes 140–145  $\mu\text{m}$  long, 10–13  $\mu\text{m}$  wide. Palpomere lengths (in mm): 60–63, 60–65, 210–230, 140–150, 260–300. Palpomere ratio ( $5^{\text{th}}/3^{\text{rd}}$ ) 1.2–1.3.

Wings (Fig. 2). VR 1.08–1.15. Brachiolum with 3–4 setae; R with 25–32 setae,  $R_1$  with 27–30 setae,  $R_{4+5}$  with 41–42 setae. Squama with 8–10 setae.

Thorax (Fig. 3). Dorsocentrals 12–14, acrostichals 14–16, prealars 4–5. Scutellum with 6–7 setae.

Legs (Fig. 4). Fore leg: width at apex of tibia 60–65 mm, tibia with scale 53–56  $\mu\text{m}$  long, with 2–4 strong setae (Fig. 5). Mid leg: width at apex of tibia 80–83 mm, tibia with two apical spurs 40–50, 43–53  $\mu\text{m}$  long. Hind leg: width at apex of tibia 70–80 mm, tibia with two apical spurs 40–50, 40–55  $\mu\text{m}$  long. Mid and hind tibiae with fused combs (Figs 6–7), each comb 36–50  $\mu\text{m}$  long. Lengths (in mm) and proportions of legs in Table 1.

Hypopygium (Fig. 8). Anal point 113–120 mm long, 15–20  $\mu\text{m}$  wide at base, 13–15  $\mu\text{m}$  wide at apex, parallel-sided, slender, apically rounded. Tergite IX with 16–17 long setae medially, posterior margin of tergite IX with 20–22 setae and 8 spines (Fig. 9). Phallapodeme 120–123 mm long; transverse sternapodeme 30–50 mm long. Gonocoxite 200–230 mm long. Superior volsella short, small and spatulate, 16–18 mm long, 20–22 mm wide, with 2 long setae (Fig. 10). Inferior volsella elongated, 190–200 mm long, with 6 long setae. Gonostylus 210–230 mm long, with 4 long setae along inner margin in distal 1/3. HR 0.95–1.00, HV 1.89–2.04.

**Female, pupa and larva.** Unknown.

**Type material.** Holotype: Male, CHINA, Zhejiang, Quzhou City, Hunan County, 19.iv.2012, leg. XL Lin, sweep net. 2 Paratypes: 2 males, same data as holotype.

**Table 1.** Lengths (in  $\mu\text{m}$ ) and proportions of leg segments in *Stenochironomus brevissimus* sp. n. (n = 3).

**Table 2.** Main differences between *S. brevissimus* sp. n., *S. hainanus* and *S. okialbus*.

	<i>S. brevissimus</i>	<i>S. hainanus</i>	<i>S. okialbus</i>
Wing	transparent, without any pigmentation	transparent, without any pigmentation	with dark bands across the middle and posterior area
Coloration	thorax light yellow, postnotum and scutum with brown spots; fore legs yellow with femur apically brown; mid legs with apex and posterior basal region of femur with dark brown stripes, tibia brown, tarsomeres 1–5 yellow; hind legs brown with femur yellow with dark brown stripes at apex	whole body yellow, without dark pigmentation	thorax yellow; fore legs yellow with femur apically brown, apex and basal region of tibia with dark brown stripes; mid legs yellow with femur apically brown; hind legs yellow with femur apically brown
Superior volsella	with 2 setae	with 3 setae	with 4 setae
Inferior volsella	with 6 setae	with 3 setae	with 4 setae and a strong terminal spine
Posterior margin of tergite IX	with 20–22 setae and 8 spines	with 16 setae	with 8 setae and 8 spines

**Etymology.** The specific epithet is a Latin adjective “*brevissimus*”, meaning the shortest, and refers to the superior volsella, which is the shortest in the genus.

**Remarks.** *S. brevissimus* sp. n. is similar to *S. hainanus* Qi, Shi & Wang, 2008 and *S. okialbus* Sasa, 1990 in having short and small superior volsella, but can separated from these species by the differences given in Table 2.

**Distribution.** The species is currently known only from Zhejiang Province of Oriental China.

*Stenochironomus linanensis* sp. n.

<http://zoobank.org/F01888A4-0CA1-4041-9290-12B68CFA5BA0>

Figs 11–18

**Diagnosis.** The adult male of *S. linanensis* sp. n. can be distinguished from all other species of *Stenochironomus* by the following combination of characters: wings transparent, body yellow, superior volsella finger-like, with 9 long setae, elongated inferior volsella with 4 long setae and one well-developed terminal spine, tergite IX with 10–15 long setae medially.

**Description.** Male imago (n = 5). Total length 2.9–3.8 mm. Wing length 1.4–1.5 mm. Total length / wing length 1.98–2.41. Wing length / length of profemur 1.30–1.57.

Coloration. Head yellow. Thorax greenish yellow. Wings transparent, without any pigmentation. Abdomen yellow, hypopygium brown. Legs pale yellow.

Head (Fig. 11). AR 1.20–1.32. Temporal with 8–14 setae. Clypeus with 9–10 setae. Tentorium 153–156 mm long, 37–42 mm wide. Stipes 72–95 μm long, 5–6 μm wide. Palpomere lengths (in mm): 45–47, 28–33, 53–60, 75–90, 110–120. Palpomere ratio (5<sup>th</sup>/3<sup>rd</sup>) 2.00–2.07.

Wings (Fig. 12). VR 1.07–1.20. Brachiolium with 2 setae; R with 16–23 setae, R<sub>1</sub> with 17–18 setae, R<sub>4+5</sub> with 22–28 setae. Squama with 5–7 setae.

Thorax (Fig. 13). Dorsocentrals 9–13, acrostichals 9–14, prealars 4–5. Scutellum with 5–6 setae.

Legs. Fore leg: width at apex of tibia 33–47 mm, tibia with scale 33–46 μm long, with 2–3 strong setae (Fig. 14). Mid leg: width at apex of tibia 50–65 mm, tibia with two apical spurs 25–28, 30–40 μm long. Hind leg: width at apex of tibia 50–60 mm, tibia with two apical spurs 32–39, 35–40 μm long. Mid and hind tibiae with fused combs (Fig. 15–16), each comb 18–22 mm long. Lengths (in mm) and proportions of legs in Table 3.

Hypopygium (Fig. 17). Anal point 65–73 mm long, 14–20 μm wide at base, 6–8 μm wide at apex, apex of anal point slightly swollen and rounded. Tergite IX
